

Supplementary Materials

Supplementary Notes

A) Molecular laboratory work, phylogenetic inference and haplotype network construction

The final 16S alignment comprised 11 sequences obtained in this study and 34 sequences from GenBank consisting of 540 bp, of which 428 sites were variable, 387 parsimony-informative, and 41 singletons; the final alignment for the *COI* gene comprised 8 sequences from our material and 30 ones from GenBank, consisting of 567 bp, of which 293 sites were variable, 282 parsimony-informative, and 11 singletons. A maximum likelihood (MA) analysis was conducted for both genetic markers using IQ-TREE (Nguyen *et al.*, 2015; Trifinopoulos *et al.*, 2016). The substitution model was not defined a priori; instead, the implemented ModelFinder (Kalyaanamoorthy *et al.*, 2017) was applied to find the best models during analysis under the Bayesian information criterion. For estimates of support, 5000 replicates of ultrafast bootstrapping (Minh *et al.*, 2013) were performed.

To infer a Bayesian (BA) phylogenetic tree from a concatenated 2-gene dataset, we conducted the analysis by applying the site-heterogeneous mixture model CAT + GTR + Γ4 implemented in the Phylobayes MPI software (Lartillot *et al.*, 2013). Two independent Monte Carlo Markov chains (MCMC) were run. We checked for the convergence in the tree space with bpcomp program and generated output of the largest (maxdiff = 0.062493) and mean (meandiff = 0.00214141) discrepancy observed across all bipartitions and generated majority-rule consensus tree using a burn-in of 10 000 trees and sub-sampling every 10 trees. Additionally, we used program Tracecomp to check for convergence of the continuous parameters of the model.

We constructed a haplotype network using the 95% limit of parsimony as implemented in TCS 1.21 (Clement *et al.*, 2002) for the available eastern Panama samples and the geographically closest GenBank sample of *Atelopus spurreli* (DQ502895.1) from Colombia, for 16S and COI separately. The raw output of TCS was visualized in PopART version 1.7 (Leigh & Bryant, 2015). The descriptive statistics for nucleotide diversity was produced also in PopART version 1.7.

B) Bioacoustics

Male advertisement calls of *Atelopus fronterizo* and *A. certus* were recorded from frogs sitting on rocks, using Panasonic RRXS410 digital recorder, and Sennheiser ME66 microphone with

K6 powering module. The microphone was held at a distance 1–1.5 m from the calling male. *Atelopus glyphus* was recorded using an Android phone, with the RecForge II App. Recordings were made at the sampling rate of 44 kHz and 16 bits resolution in uncompressed PCM format and saved as wav files. Call recordings of *A. varius* from Panama highlands were provided by E. Griffith, recorded in captivity at El Valle Amphibian Conservation Center (EVACC), the call of *A. zeteki* was recorded by A. Batista using a cellphone with the RecForge II App in October 11th 2019 at EVACC, the call of *A. limosus* was provided by R. Ibañez,. For each call, we analyzed call duration, pulse duration, pulses per second, call interval, and minimum, maximum, and dominant frequencies. The spectral and temporal parameters analysis follow Batista *et al.* (2016). Temporal measurements of calls such as call duration (msec), call interval (msec), pulse rate (pulses/sec), number of pulses and calls/bouts were taken on the waveforms view of Raven. Terminology used in the advertisement call description follows Zimmermann (1990) and Erdtmann & Amézquita (2009). The call repetition rate was calculated as the number of calls per call bout duration. The environmental temperature and humidity were measured using a digital thermo-hygrometer Garden HighPro Medium.

C) Synonomy

Atelopus fronterizo sp. nov.

Atelopus glyphus – Puerto Obaldia: Guna Yala: Panama (USNM 48594-5 adult) Dunn (1931)

Atelopus varius glyphus Rio Sucubti, Chalichiman's Cr. – Breder (1946)

Atelopus sp. – Rio Sucubti, Chalichiman's Cr., Tacarcuna Village: Darien; Puerto Obaldia: Armila: Guna Yala – Savage (1972)

Atelopus sp. – Sasardi camp, Guna Yala – Cocroft *et al.* (1990)

Atelopus sp. – Lötters (1996)

Atelopus spurrelli – Rivera_Correa (2005)

Atelopus aff. *limosus* – Capurganá: Colombia – Flechas *et al.* (2017a)

Atelopus aff. *limosus* – Cerro Tarcacuna, Darien National Park: Darién – Lewis *et al.* (2019)

Atelopus sp. Puerto Obaldía – Capurganá – Ramírez *et al.* (2020)

Supplementary Figures

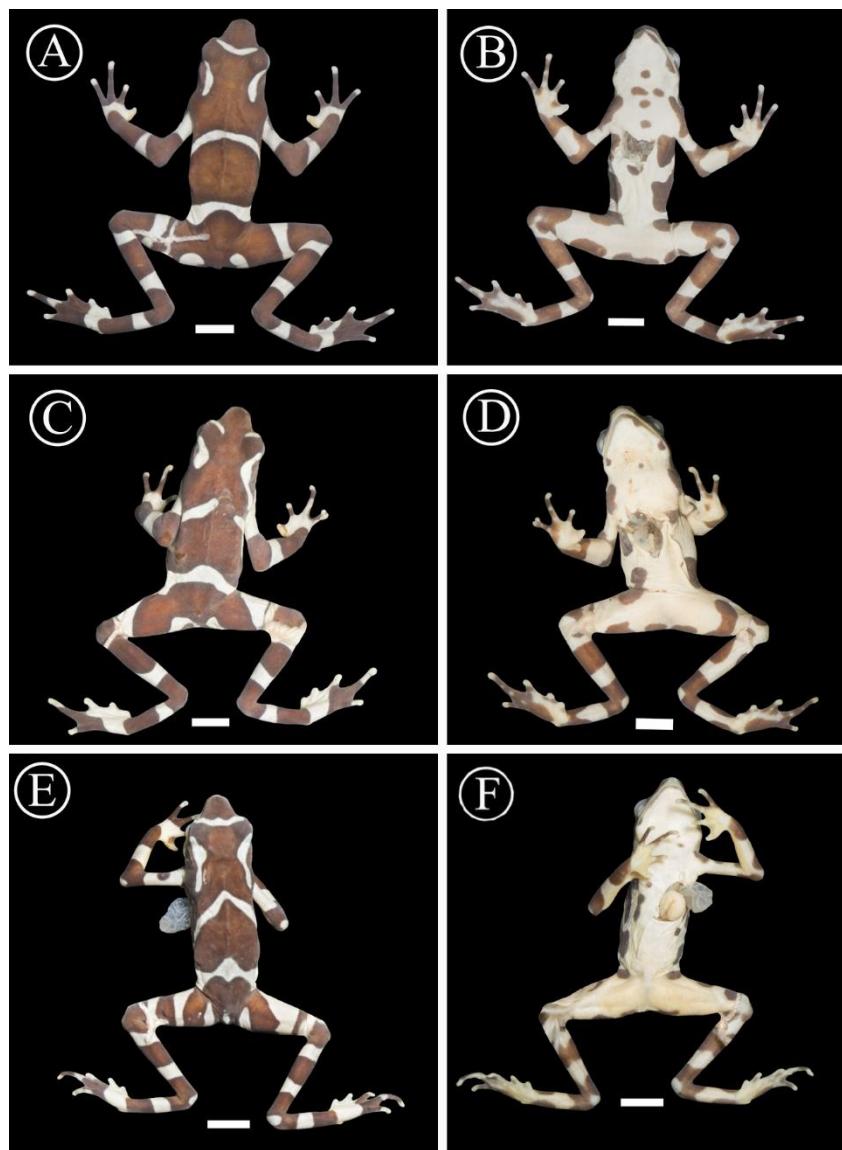

Supplementary Figure S1. Bayesian tree based on concatenated sequences of 16S and COI of *Atelopus* from Panamá and adjacent Colombia (*A. spurrelli*). Posterior probabilities >0.80 are shown above branches. Specimens are indicated by their museum voucher numbers. Scale represents estimated substitutions per site.

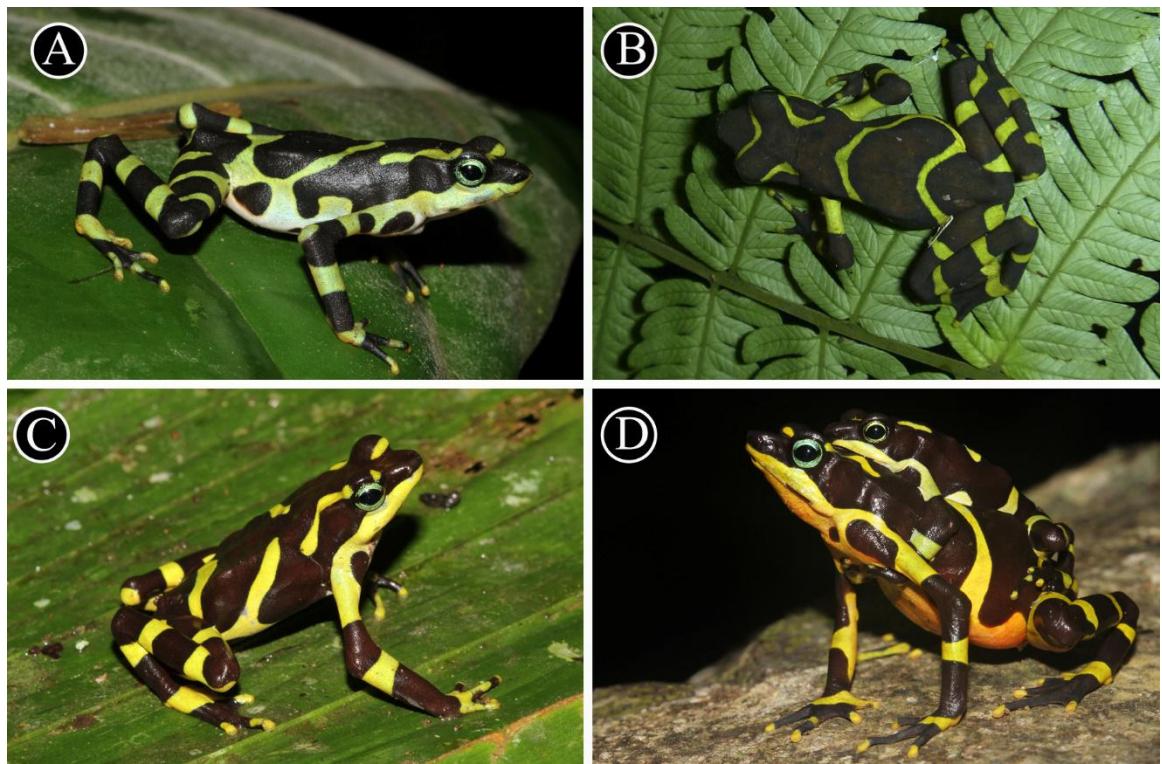

Supplementary Figure S2. Haplotype networks of mitochondrial COI and 16S genes. Species are presented by colors. Sizes of circles are proportional to sample size. Each hatch mark on lines connecting haplotypes represents a single nucleotide substitution. Small black circle represents inferred intermediate haplotype.

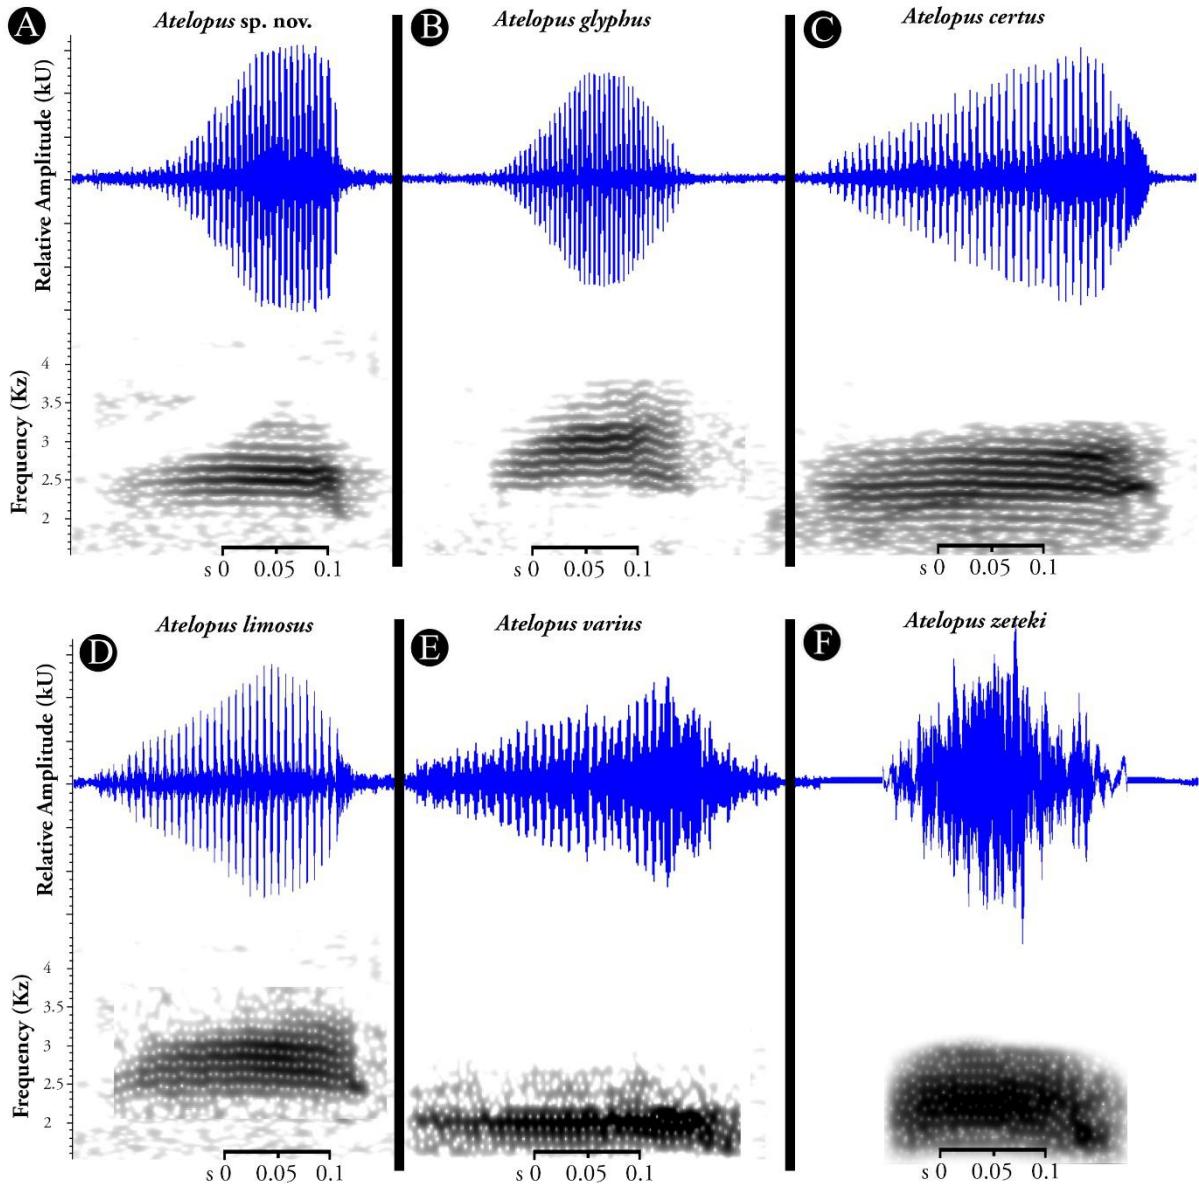

Supplementary Figure S3. Discriminant function analysis of morphometric characters of *Atelopus* species from eastern Panama. Variables included in analysis: HW/SVL, EYND/HW, TIBL/SVL, HAL/SVL, THBL/SVL, IND/IOD, HL/HW, FTL/SVL, FTL/TIBL, THBL/HAL.

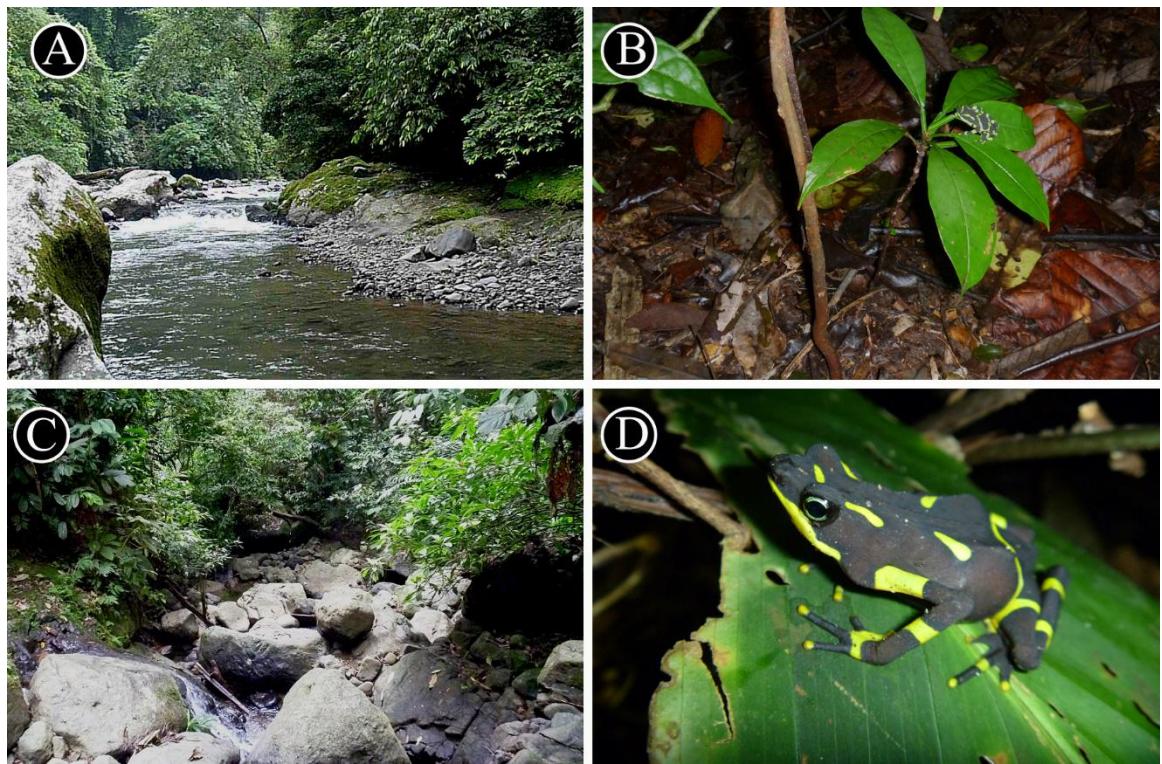

Supplementary Figure S4. Paratype specimens of *Atelopus frakterizo* sp. nov. in preservative **A-B)** SMF 97122; **C-D)** MHCH 2655; **E-F)** MHCH 2657.

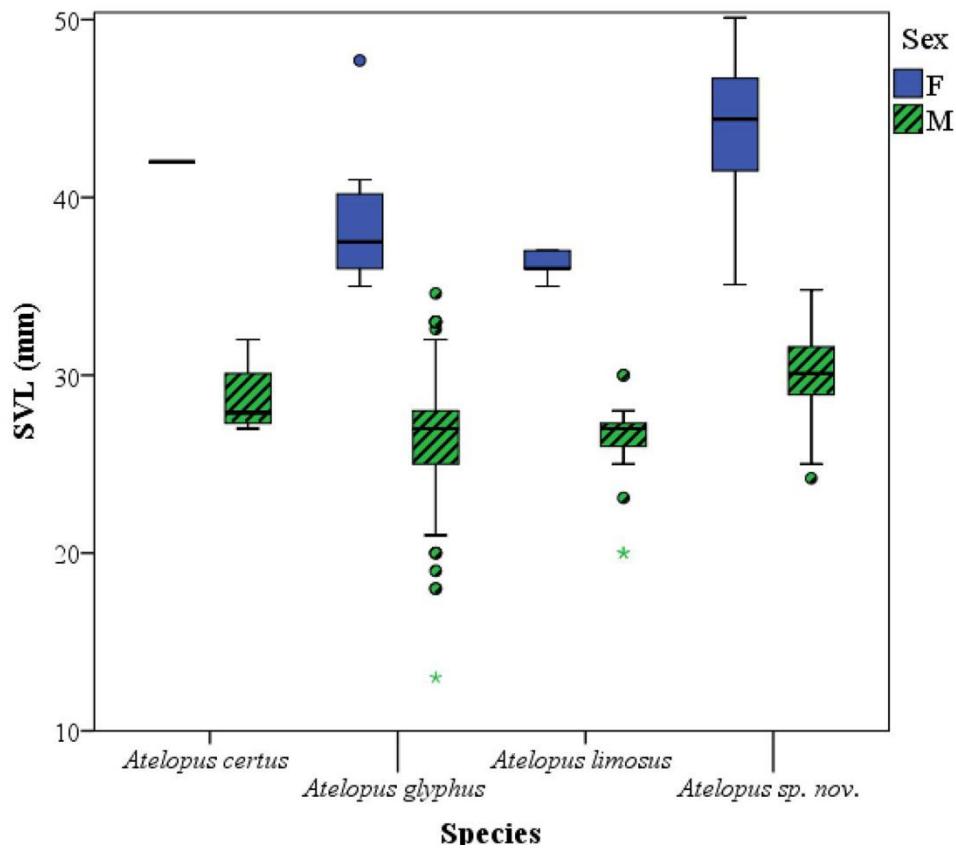

Supplementary Figure S5. Color variation of *Atelopus fronterizo* sp. nov. in life: A) Paratype, Pechito Parao near Tuquesa river (MHCH 2657); B) Male, from Nurra Caribe (not collected); C) Paratype, Nurra Caribe (MHCH 2655); D) Amplexus from Nurra Caribe (not collected).

Supplementary Figure S6. Oscillograms (above) and spectrograms (below) of advertisement calls of six species of *Atelopus* from Panama. A) *Atelopus fronteirizo* sp. nov. (from San Blas Mountain range, 3 October 2021, 09:49 h, 339 m asl, 25.5 °C; B) *A. glyphus* (from Darien National Park, 250 m asl, 12 December 2019, ♂ 11:13 h); C) *A. certus* (from Garachiné, Chepigana, Darién, Panamá, 200 m asl, 10 April 2014, 18:00 h, 28.1 °C; D) *A. limosus*, (from Panama Central, provided by R. Ibañez); E) *A. varius* (from Panama highlands, provided by E. Griffith); F) *A. zeteki* (in captivity at El Valle Amphibian Conservation Center, EVACC). See Supplementary Notes 1 for more details.

Supplementary Figure S7. Habitat of *Atelopus fronterizo* sp. nov. A) Type locality at Pucuro River; B) Pechito Parado Mount, at Rio Tuquesa, male found at night in understory, at least 1 km from nearest stream; C) Nurra Caribe, Taintidu stream; D) Female from Nurra Caribe, photographed at night near Taintidu stream.

Supplementary Figure S8. Differences in snout-vent length (SVL) of *Atelopus* species from eastern Panama, separated by sex. Bottom and top of box are first and third percentiles respectively, and band inside box represents median, whiskers show extreme values; circles and asterisk above or below boxes represent outliers. *Atelopus frakterizo sp. nov.* n: females=13, males=37; *A. glyphus*, n: females=10, males=124; *A. certus*, n: females=1, males=4; *A. limosus*, n: females=5, males=22.

Supplementary Tables

Supplementary Table S1. Numbers of voucher specimens included in morphological analysis or comparison. Specimens not collected were captured, measured, and released under a monitoring project. Those with field numbers were documented photographically.
